Mr. William Thompson  
Regional Air Pollution Control Engineer  
Seventh Floor Feller Building  
301 Market Street  
Harrisburg, Pennsylvania 17120

Dear Mr. Thompson:

Whitmoyer Laboratories, after several years abeyance, is planning again to manufacture arsanilic acid. It is planned to start production about May 1, 1977.

There will be three new process emission sources and three exhaust fans. Two chemicals are capable of being emitted to the atmosphere: aniline (AN) and perchloroethylene (PCE). These will be emitted in small quantities, as indicated in the attached table. We believe these emissions are so small to be of any significance and, thus should be exempt from plan approval. Because of the small quantities emitted, no pollution control devices are planned.

We do, however, request a permit to operate, and the approximate forms for sources A and D are enclosed. Sources B and C have emissions too small to be of concern.

Our use of perchlorethylene in this application is confidential information and we request you treat it accordingly.

Very truly yours,

Franz A. Dengler  
Environmental Manager
